dPt Titrode

Overview

1 Overview

1.1 dPt Titrode – Product description

The dPt Titrode is a metal electrode for redox titrations without alteration of the pH value. The dPt Titrode is a dTrode (digital electrode) for OMNIS.

1.2 dPt Titrode - Overview

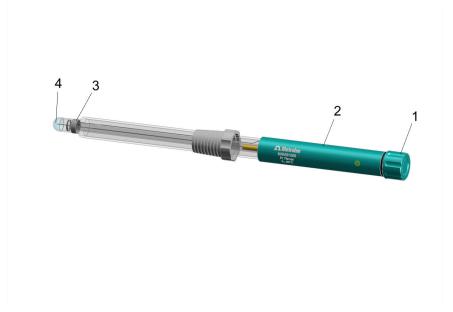

Figure 1 dPt Titrode

- 1 Protective cap 2 Electrode head

2 Functional description

2.1 Pt metal electrode – Functional description

Pt metal electrodes have a bare metal surface that is exposed to the solution. If redox-active ions are present in the sample solution, a concentration-dependent potential appears on the Pt surface. This concentration-dependent equilibrium is characterized by a corresponding potential (Galvani potential).

Delivery and packaging

3 Delivery and packaging

3.1 Delivery

Inspect the delivery immediately upon receipt:

- Check the delivery against the delivery note to ensure completeness.
- Check the product for damage.
- If the delivery is incomplete or damaged, contact your regional Metrohm representative.

3.2 Packaging

The product and accessories are supplied in protective special packaging. Keep this packaging to ensure safe transportation of the product. If a transport locking device is present, keep this as well for future reuse.

3.3 Unpacking and assessing the sensor

NOTICE

Avoid applying excess pressure to the tool. Otherwise, the sensor could be released too abruptly.

Defective sensors must be sent back for warranty processing within two months (starting from the day of delivery).

Required accessories:

Tool for fixed sensors (included)

1 Unpacking the sensor

Remove the sensor with storage vessel from the packaging.

Storing the dPt Titrode

2 Removing the storage vessel

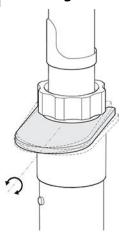

Figure 2 Loosening the sensor from the storage vessel

- Hold the sensor and storage vessel firmly in your hand so that the sensor cannot slip away.
- Position the tool between the storage vessel and the ground-joint sleeve.
- Carefully push the tool to the side to release the sensor.
 Do not tip the tool forwards!

3 Checking the sensor for proper function

Preparing the sensor:

(see "Preparing the dPt Titrode", chapter 4.1, page 5)

Checking the electrode:

(see "Assessing the dPt Titrode", chapter 5.1, page 8)

3.4 Storing the dPt Titrode

The electrode head must be stored as follows to protect it from water, solvents, dust and mechanical influences:

- 1 Screw the protective cap (1-1) onto the electrode head (1-2).
- Store the electrode in the storage vessel. When doing so, ensure that the glass membrane (1-4) is immersed in the corresponding storage solution.
 - We recommend using distilled water as a storage solution.
 Always store the electrode in the storage solution.

Installation -----

Installation

4.1 **Preparing the dPt Titrode**

1 Cleaning the electrode

CAUTION

Property damage caused by damaged glass membrane

Electrode damage caused by damaged glass membrane

- Never touch the electrode glass membrane with your hand.
- Only treat the electrode glass membrane with a suitable detergent according to instructions.
- Rinse the electrode with distilled water.
- If there is excess contamination on the metal ring, clean it with a moist towel and toothpaste or with the polishing set (6.2802.000).
- If necessary, use a suitable solvent to degrease the electrode.
- The electrode should be rinsed before each measurement. Frequent abrasive cleaning is not recommended.

2 Connecting the electrode

- Unscrew the protective cap (1-1).
- Position the cable connection on the electrode head such that the slot in the cable connection is on the guide lug of the electrode head.
- Push the socket in the cable connection into the plug inside the electrode head.
- Push the outer ring of the cable connection over the electrode
 - Ensure that the guide lugs in the electrode head are in the grooves of the cable connection.
- Push the cable connection onto the electrode head until it stops and rotate the outer ring until it snaps in place.
- To remove the cable, first release the outer ring and then carefully pull the cable connection from the electrode head. When doing so, be sure not to pull on the cable itself but the cable connector instead.

---- 5

Mounting the electrode

4.2 Mounting the electrode

The electrode must sit securely in the titration head.

For automatic procedures, ensure that the cables have enough room to move.

During the titration, it is important that the solution is mixed well. The stirring rate should be high enough to form a small vortex. If the stirring rate is too high, then air bubbles will be aspirated. These may result in incorrect measured values. If the stirring rate is too low, then the solution is only mixed slowly and the reaction time or titration time increases accordingly.

In order for the measurement to be taken in a well-mixed solution after the addition of the titrant, the titration tip should be positioned where turbulence is high. Furthermore, the distance between the addition of the titrant and the electrode should be as large as possible. Therefore, take into account the stirring direction (counterclockwise or clockwise) when positioning the electrode and titration tip.

6

Installation

Assessing the dPt Titrode

5 Maintenance

5.1 Assessing the dPt Titrode

Using standard titration to assess the electrode

- 1 Fill a 100-mL beaker with 50 mL of deionized water.
- Add 2 mL of iodine solution (*c*=0.05 mol/L).
- Add 1 mL of sulfuric acid (c=0.1 mol/L).
- While stirring this mixture, titrate it with sodium thiosulfate (c=0.1 mol/L) under the following conditions:

Method	DET U
Dosing rate	Max.
Signal drift	50 mV/min
Min. waiting time	0 s
Max. waiting time	26 s
Measuring point distance	4
Min. increment	10.0 µL
Dosing rate	Max.
Stop volume	3 mL
Stop EP	9
Filling rate	Max.
EP criterion	5
EP recognition	All

- **5** Compare the measurement result with the following specifications:
 - Consumption (EP) [mL]:

1.95 - 2.05

 Potential jump [mV]: deltaU_{90-110%} > 70 mV

• Titration time [s]: approx. 150

Maintenance

If the measurement result does not correspond to the specifications, clean the electrode and run the test again. If titration times are excessive, the stirring rate and the arrangement of the stirrer, pipetting tip and electrode should be checked.

9

6 Troubleshooting

Problem	Cause	Remedy	
Slow response	Grease and oils form an insulating layer on the electrode.	Clean the electrode with solvent.	
	If weak redox buffered sol- utions are used, ions such as oxides may be absorbed at the surface of the elec- trode.	Abrasive, oxidative (for oxidizing solutions) or reducing (for reducing solutions) pretreatment.	
Incorrect potential	Grease and oils form an insulating layer on the electrode.	Clean the electrode with solvent.	

Metal electrode – Disposal

7 Metal electrode – Disposal

This product is covered by European Directive, WEEE – Waste Electrical and Electronic Equipment.

The correct disposal of your old instrument will help to prevent negative effects on the environment and public health.

Proceed as follows to dispose of the electrode:

1 Disposing of the electrode

Put the electrode in electronic waste recycling.

More details about the disposal of your old product can be obtained from your local authorities, from waste disposal companies or from your local dealer.

Ambient conditions
